Subject: PEDIATRICIANS TOLD TO LOOK OUT FOR HEALTH HAZARDS FROM WELL WATER

Dear Aquathin Dealer OnLine;

As water treatment professionals and Aquathin U. graduates, we all are fully aware of the issues with nitrates in well water. But when these articles are published (see quick read below), they are always good to collect and have ready to show your well water Customers.

This article points out that well water issues are to be diagnosed by pediatricians. Another interesting point in this article is the amount of contaminated well water "users". I would respectfully recommend that you send a letter to your local pediatricians with this article and a World of Aquathin brochure advising them that you are available to discuss alternatives to nitrates and other contaminants. Some well water users may be purchasing bottled water "to drink" but rinsing foods and cooking with well water due to the expense of bottled water. No winning here...the vegetables absorb the nitrates etc.

Also, with the price of gasoline, businesses and households begin to exercise cutbacks, and the first to always go during a recession (this is experience talking) is bottled water rentals and grocery store purchases of bottled water. **DO THE MATH FOR YOUR PROSPECTIVE CUSTOMERS ! AND SHOW THEM THE COST EFFECTIVE PENNIES A DAY ULTRA PURIFIED WATER BY AQUATHIN...AND UNLIMITED, SO COOK WITH IT TOOOOOO !**

I LOVE MY AQUATHIN !

Warmest regards to all...as well, your comments are always welcome and very much appreciated.

Well Water a Danger to Infants

-- Dennis Thompson -- Dennis Thompson,

TUESDAY, Sept. 6 (HealthDay News) -- Formula and food prepared with well water can cause nitrate poisoning in infants, leading the American Academy of Pediatrics (AAP) to issue a warning for families using wells for their drinking water.

These families should have their water tested regularly, and breastfeed their infants if possible, the AAP said in a report in the September issue of Pediatrics.

The report also recommends that pediatricians ask new parents about well water use during prenatal and check-up visits.

Nitrates are a natural component of plants and some fertilizers, and they often seep into well water. Adults naturally pass nitrates through urine, but they can cause a dangerous blood condition in children that limits oxygen in the circulation.

An estimated 15 million families drink water from private, unregulated wells, and 2 million families drink from wells that fail to meet federal drinking-water standards for nitrate, according to the AAP.

Academy experts added that because vegetables can have nitrate levels as high or higher than well water, infants should not eat those foods until after three months of age.
